

Literal Syntax vs Constructor Syntax

Musab Salih Şakar

- There are two main ways to declare an array which are literal syntax(`array=[]`,etc.) and constructor syntax(`array = new Array()`,etc.).
- Literal syntax is preferred over constructor syntax from by most programmers.
- Literal syntax is easier, shorter and more practical than constructor syntax. This is the main reason why it is more preferred.

- `Array()` structure in constructor syntax can be overridden therefore it may cause problems in projects if a function named “Array” defined.
- Alerts in constructor syntax is confusing.
